Stack Overflow: Tag Prediction

1. Business Problem

1.1 Description

Description

Stack Overflow is the largest, most trusted online community for developers to learn, share their programming knowledge, and build their careers.

Stack Overflow is something which every programmer use one way or another. Each month, over 50 million developers come to Stack Overflow to learn, share their knowledge, and build their careers. It features questions and answers on a wide range of topics in computer programming. The website serves as a platform for users to ask and answer questions, and, through membership and active participation, to vote questions and answers up or down and edit questions and answers in a fashion similar to a wiki or Digg. As of April 2014 Stack Overflow has over 4,000,000 registered users, and it exceeded 10,000,000 questions in late August 2015. Based on the type of tags assigned to questions, the top eight most discussed topics on the site are: Java, JavaScript, C#, PHP, Android, jQuery, Python and HTML.

Problem Statemtent

Suggest the tags based on the content that was there in the question posted on Stackoverflow.

1.3 Real World / Business Objectives and Constraints

1. Predict as many tags as possible with high precision and recall.
2. Incorrect tags could impact customer experience on StackOverflow.
3. No strict latency constraints.

2. Machine Learning problem

2.1 Data

2.1.1 Data Overview

Refer: https://www.kaggle.com/c/facebook-recruiting-iii-keyword-extraction/data
All of the data is in 2 files: Train and Test.

Train.csv contains 4 columns: Id,Title,Body,Tags.

Test.csv contains the same columns but without the Tags, which you are to predict.

Size of Train.csv - 6.75GB

Size of Test.csv - 2GB

Number of rows in Train.csv = 6034195

The questions are randomized and contains a mix of verbose text sites as well as sites related to math and programming. The number of questions from each site may vary, and no filtering has been performed on the questions (such as closed questions).

Data Field Explaination

Dataset contains 6,034,195 rows. The columns in the table are:

Id - Unique identifier for each question

Title - The question's title

Body - The body of the question

Tags - The tags associated with the question in a space-seperated format (all lowercase, should not contain tabs '\t' or ampersands '&')

2.1.2 Example Data point

Title: Implementing Boundary Value Analysis of Software Testing in a C++ program?
Body :

```
#include<
```

```
#include<

}\n
```

\n\n

The answer should come in the form of a table like
\n\n

```
         1          50          50\n
         2          50          50\n

            50          50              99\n
            50          50              100\n

\n\n

if the no of inputs is 3 and their ranges are\n
        1,100\n
        1,100\n
        1,100\n
        (could be varied too)
\n\n

The output is not coming,can anyone correct the code or tell me what\'s wrong?

2.2 Mapping the real-world problem to a Machine Learning Problem

2.2.1 Type of Machine Learning Problem

It is a multi-label classification problem
Multi-label Classification: Multilabel classification assigns to each sample a set of target labels. This can be thought as predicting properties of a data-point that are not mutually exclusive, such as topics that are relevant for a document. A question on Stackoverflow might be about any of C, Pointers, FileIO and/or memory-management at the same time or none of these.
__Credit__: http://scikit-learn.org/stable/modules/multiclass.html

2.2.2 Performance metric

Micro-Averaged F1-Score (Mean F Score) : The F1 score can be interpreted as a weighted average of the precision and recall, where an F1 score reaches its best value at 1 and worst score at 0. The relative contribution of precision and recall to the F1 score are equal. The formula for the F1 score is:

*F1 = 2 * (precision * recall) / (precision + recall)*

In the multi-class and multi-label case, this is the weighted average of the F1 score of each class.

'Micro f1 score':
Calculate metrics globally by counting the total true positives, false negatives and false positives. This is a better metric when we have class imbalance.

'Macro f1 score':
Calculate metrics for each label, and find their unweighted mean. This does not take label imbalance into account.

https://www.kaggle.com/wiki/MeanFScore
http://scikit-learn.org/stable/modules/generated/sklearn.metrics.f1_score.html

Hamming loss : The Hamming loss is the fraction of labels that are incorrectly predicted.

153 Tags are used more than 10000 times
14 Tags are used more than 100000 times

Observations:

1. There are total 153 tags which are used more than 10000 times.
2. 14 tags are used more than 100000 times.
3. Most frequent tag (i.e. c#) is used 331505 times.
4. Since some tags occur much more frequenctly than others, Micro-averaged F1-score is the appropriate metric for this probelm.

3.2.4 Tags Per Question

In [27]:

Observations:

1. Maximum number of tags per question: 5
2. Minimum number of tags per question: 1
3. Avg. number of tags per question: 2.899
4. Most of the questions are having 2 or 3 tags

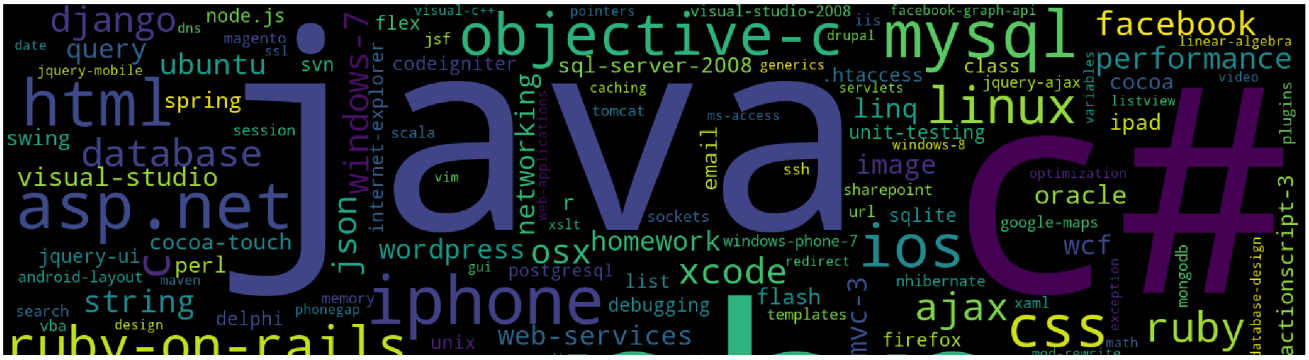
3.2.5 Most Frequent Tags

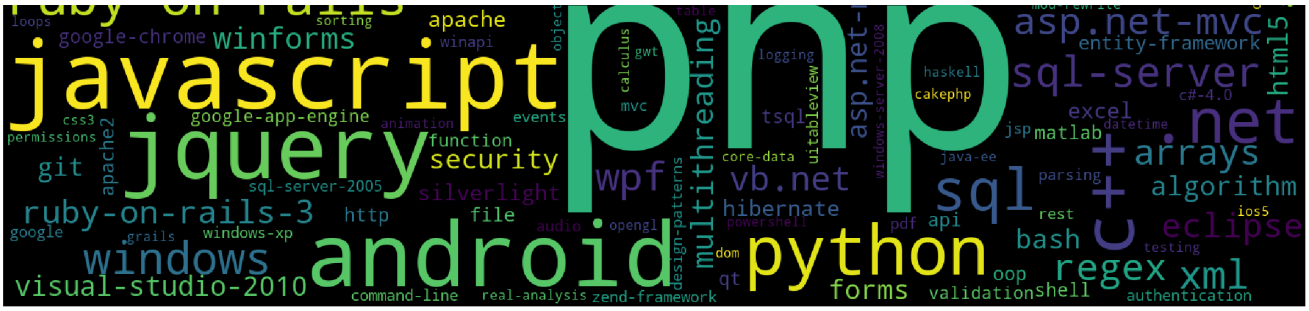
In [30]:

```
# Ploting word cloud
start = datetime.now()

# Lets first convert the 'result' dictionary to 'list of tuples'
tup = dict(result.items())
#Initializing WordCloud using frequencies of tags.
wordcloud = WordCloud(    background_color='black',
                          width=1600,
                          height=800,
                    ).generate_from_frequencies(tup)

fig = plt.figure(figsize=(30,20))
plt.imshow(wordcloud)
plt.axis('off')
plt.tight_layout(pad=0)
fig.savefig("tag.png")
plt.show()
print("Time taken to run this cell :", datetime.now() - start)
```





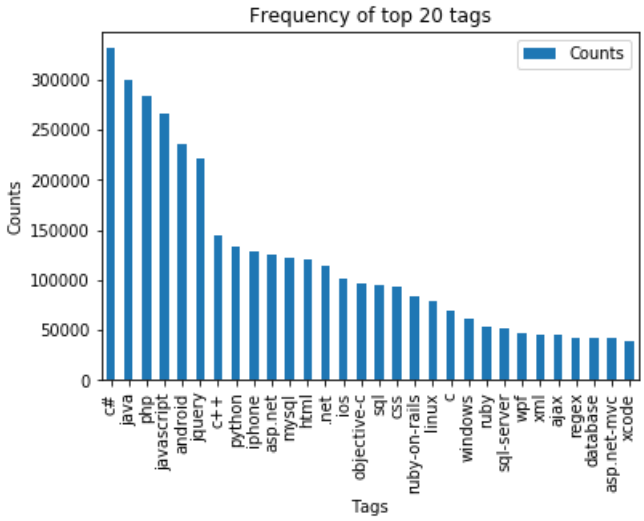
```
Time taken to run this cell : 0:00:04.929611
```

Observations:
A look at the word cloud shows that "c#", "java", "php", "asp.net", "javascript", "c++" are some of the most frequent tags.

3.2.6 The top 20 tags

In [31]:

```
i=np.arange(30)
tag_df_sorted.head(30).plot(kind='bar')
plt.title('Frequency of top 20 tags')
plt.xticks(i, tag_df_sorted['Tags'])
plt.xlabel('Tags')
plt.ylabel('Counts')
plt.show()
```



Observations:

1. Majority of the most frequent tags are programming language.
2. C# is the top most frequent programming language.
3. Android, IOS, Linux and windows are among the top most frequent operating systems.

3.3 Cleaning and preprocessing of Questions

3.3.1 Preprocessing

1. Sample 1M data points
2. Separate out code-snippets from Body
3. Remove Spcial characters from Question title and description (not in code)
4. Remove stop words (Except 'C')
5. Remove HTML Tags
6. Convert all the characters into small letters

7. Use SnowballStemmer to stem the words

In [32]:

```
def striphtml(data):
    cleanr = re.compile('<.*?>')
    cleantext = re.sub(cleanr, ' ', str(data))
    return cleantext
stop_words = set(stopwords.words('english'))
stemmer = SnowballStemmer("english")

4. Machine Learning Models

4.1 Converting tags for multilabel problems

X	y1	y2	y3	y4
x1	0	1	1	0
x1	1	0	0	0
x1	0	1	0	0

In [41]:

```
# binary='true' will give a binary vectorizer
vectorizer = CountVectorizer(tokenizer = lambda x: x.split(), binary='true')
multilabel_y = vectorizer.fit_transform(preprocessed_data['tags'])
```

We will sample the number of tags instead considering all of them (due to limitation of computing power)

In [42]:

```
def tags_to_choose(n):
    t = multilabel_y.sum(axis=0).tolist()[0]
    sorted_tags_i = sorted(range(len(t)), key=lambda i: t[i], reverse=True)
    multilabel_yn=multilabel_y[:,sorted_tags_i[:n]]
    return multilabel_yn

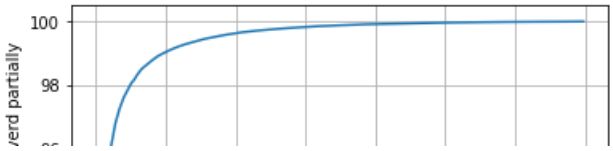
def questions_explained_fn(n):
    multilabel_yn = tags_to_choose(n)
    x= multilabel_yn.sum(axis=1)
    return (np.count_nonzero(x==0))
```

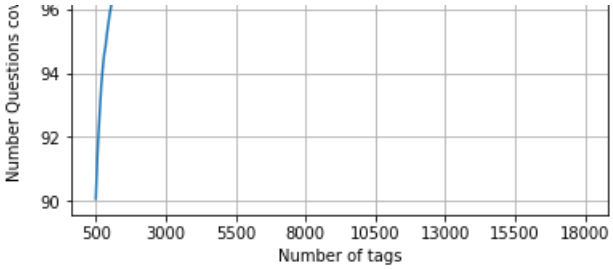
In [43]:

```
questions_explained = []
total_tags=multilabel_y.shape[1]
total_qs=preprocessed_data.shape[0]
for i in range(500, total_tags, 100):
    questions_explained.append(np.round(((total_qs-questions_explained_fn(i))/total_qs)*100,3))
```

In [44]:

```
fig, ax = plt.subplots()
ax.plot(questions_explained)
xlabel = list(500+np.array(range(-50,450,50))*50)
ax.set_xticklabels(xlabel)
plt.xlabel("Number of tags")
plt.ylabel("Number Questions coverd partially")
plt.grid()
plt.show()
# you can choose any number of tags based on your computing power, minimun is 50(it covers 90% of
the tags)
print("with ",5500,"tags we are covering ",questions_explained[50],"% of questions")
```





```
with  5500 tags we are covering  99.043 % of questions
```

In [46]:

```
multilabel_yx = tags_to_choose(5500)
print("number of questions that are not covered :", questions_explained_fn(5500),"out of ", total_

```

```
Number of tags in sample : 35403
number of tags taken : 5500 ( 15.535406603960118 %)

We consider top 15% tags which covers 99% of the questions

4.2 Split the data into test and train (80:20)

In [48]:

y_test = multilabel_yx[train_size:total_size,:]
```

In [49]:

```
print("Number of data points in train data :", y_train.shape)
print("Number of data points in test data :", y_test.shape)
```

```
Number of data points in train data : (799999, 5500)

4.3 Featurizing data

In [49]:

print("Time taken to run this cell :", datetime.now() - start)
```

```
Time taken to run this cell : 0:10:47.410809
```

In [50]:

4.5.1 Preprocessing of questions

1. Separate Code from Body
2. Remove Spcial characters from Question title and description (not in code)
3. **Give more weightage to title : Add title three times to the question**
4. Remove stop words (Except 'C')
5. Remove HTML Tags
6. Convert all the characters into small letters
7. Use SnowballStemmer to stem the words

1.Use bag of words upto 4 grams and compute the micro f1 score with Logistic regression(OvR).

2.Perform hyperparam tuning on alpha (or lambda) for Logistic regression to improve the performance using GridSearch.

3.Try OneVsRestClassifier with Linear-SVM (SGDClassifier with loss-hinge)

Note:Loading with 0.5million points would take more time so taking sample os 100K data points

Conclusion

- According to our ploblem statment we have to Suggest the tags based on the content that was there in the question posted on Stackoverflow. lets start with step-by-step process to solve this problem.

lets start -->

1.As we know we have dataset which contains 6,034,195 rows. The columns in the table are: ID, TITLE, BODY and TAGS(class of our dataset) which besically decides that question belongs to which class as in this we have multiple tags related/belongs to one question we are treating this as multilable classes for detailed please go above i.e 3.2 how we are doing this.

2.Now lets start with EDA of given dataset so that we will able to analyse deeply about the data so that we will know which features to use which to not and some preprocessing and cleanning of data before that like ckecking for the presence of duplicate rows now of unique questions no of tags present and lots more. And after that we will try to analyse our class lables that is with column name tags as we can see each question has one or more than tags so and this is not the 2 class classification and each question can be taged to multiple classes at a time so we decide to treat as multilable classes means one question can belongs to one or more than one tags at a time, but before that we will do some EDA on our tag like total no of unique tags present, avg no of tags present to each questions max no of tags and min no of tags belongs to each questions and which tags appears how much time for the questions so that we will able to know which tags are most imp and which are usefull for us.

3.As during EDA we can see that total no if tags present is to much i.e is roughly 42048 see in (3.2.1) that is to many so we will try to

plot the Distribution of number of times tag appeared questions and try to take the top Most Frequent Tags. observation see

4.Now after doing lots of EDA on our data set we will clean and preprocess our data set to remove duplicates and unwanted elements like html tags and lots more

5.Before start with our Machine learning models we will Converting tags for multilabel problems using CountVectorizer and w will sample the number of tags instead considering all of them (due to limitation of computing power) and as you can see in with 5500 tags we are covering 99.03 % of questions so we will choose top 5500 tags.

6.And most important we will Featurize our dataset with more weight to tile in our datsset and then we are ready to apply Machine learning models on it i.e Logistic and linear models as we know our dataset is high dim data set and we know linear models woks better on high dim dataset so we use logistic and linear svn(and insted of linear svm we will try sgd and as we know sgd is much more faster and efficient than linear svm) and then try to train our model on it.And most imp our performance matrix we will use Micro f1 score

7.In next step we will try our models with other vectorizer i.e bag of words upto 4 grams and try to do some hyperparameter tuning in order to improve the model performance.

- Note : As we know our we have tags as a class lables and which are multilables so here we are using OneVsRestClassifier with our models
